AB - HU--26290 Pregnant sows are given natural zeolites in quantities of 12-20wt.% of their normal feed from 20-50 days before giving birth to the end of the suckling period. Prodn. pigs are given the same feed supplement from birth to slaughter. The zeolite feed supplement causes the new-born piglets to be 8-10% heavier and the fattening period to the same wt. to be 10-14 days shorter, than without the additive. The animals need 8-10% less feed per unit wt. Increase if zeolites are used.
